

I'm not robot!

Sublime text json formatter macos.

I like Sublime Text 4 as a fast and versatile editor. Unfortunately, I always forget the command to format JSON files. This is mainly because it takes more steps than a single key combination: CTRL + SHIFT + P to open the Command Palette Start to type "pretty": Select "Pretty JSON: Format JSON" Be aware, this only works if you installed the Pretty JSON package. 11 Feb 2016 - Help improve this post Install this packages via CMD + SHIFT + P > Install package > Search for Pretty JSON and install. And then turn ugly json via CMD + CTRL + J (OSX) CTRL + ALT + J (Windows/Linux) in pretty JSON! This package is written by Nikolajus Krauklis and available on GitHub. Happy coding! - Found a mistake or a typo? Please submit a PR to my GitHub-repo. I have come across this issue too. I tried to figure it out by install jsFormat as follows: Open Package Control panel command+shift+p (mac), install package. Install jsFormat. Edit the shortcut for the jsformat: Choose Key-Binding user, then edit [ { "keys": [ "command+l" ], "command": "reindent" }, { "keys": [ "ctrl+shift+s" ], "command": "auto save" }, { "keys": [ "ctrl+alt+l" ], "command": "js format" } ] So next time when you try to format json code, just use ctrl+alt+l. That's all. Hope this will help you. Cheers Install this packages via CMD + SHIFT + P > Install package > Search for Pretty JSON and install. And then turn ugly json via CMD + CTRL + J (OSX) CTRL + ALT + J (Windows/Linux) in pretty JSON! Source is on GitHub. Credit If you look at the source, the name of the sublime plugin.TextCommand subclass is SublimeJsonReindentCommand. Per the conventions for command names, the resulting command is named sublime\_json\_reindent. Simply change your key binding to: { "keys": ["ctrl+shift+l"], "ctrl+shift+j"}, "command": "sublime\_json\_reindent" }, and you should be all set. Tags: json indentation Sublmetext2 Sublime Text Plugin Prettify/Minify/Query/Goto/Validate/Lint JSON plugin for Sublime Text 3 & 4 Updates All keybindings have been removed in favor of the Command Palette. And to allow for users to configure their own specific key bindings. This also prevents key binding overrides which conflict with other packages. For good documentation on key bindings I recommend you review the Official Docs or Community Docs Installation Package Control (Recommended) Install this sublime text 3 / 4 package via Package Control search for package: "Pretty JSON" Manual Installation Sublime Text 4 cd (MacOS: ~/Library/Application Support/Sublime) Text/Packages) git clone "Pretty JSON" Sublime Text 3 cd (MacOS: ~/Library/Application Support/Sublime) Text/3/Packages) git clone "Pretty JSON" cd Pretty JSON git checkout st3 Sublime Text 2 No longer supported Usage To prettify JSON, make selection of json (or else it will try to use full view buffer) and through Command Palette Ctrl+Shift+P find "Pretty JSON: Format JSON" (you can search for part of it like 'pretty format') If selection is empty and configuration entry use\_entire\_file if\_no\_selection is true, tries to prettify whole file If JSON is not valid it will be displayed in status bar of Sublime Text Validate JSON Using Command Palette Ctrl+Shift+P find "Pretty JSON: Validate" (you can search for partial string 'validate') this will validate selection or full file and will show in dialog if it's valid or invalid. In case of found errors view will jump to error and will highlight it Compress / Minify JSON Using Command Palette Ctrl+Shift+P find "Pretty JSON: Minify JSON" (you can search for part of it like 'json minify') this will make selection or full buffer as single line JSON which later you can use in command lines (curl/httpie) or somewhere else... To map a key combination like Ctrl+Alt+M to the Minify command, you can add a setting like this to your sublime-keymap file (eg: Packages/User/Default (Windows) sublime-keymap). { "keys": [ "ctrl+alt+m" ], "command": "un\_pretty\_json" } List of commands that can be mapped to shortcuts pretty\_json un\_pretty\_json goto\_symbol Convert JSON to XML Using Command Palette Ctrl+Shift+P search for "Pretty JSON: json2xml" (you can search for part of it like '2XML') this will convert your selected JSON of full buffer to XML and replace syntax and buffer to XML output ./jq query/filter usage Demo: If on your machine './jq' tool is available with ctrl+alt+shift+j you can run against your json. output will be opened in new view so you can once again apply jq on new buffer You can find instructions of tool here: Configuration Check all the available configuration keys and their default values by using the Command Palette Ctrl+Shift+P and searching for Preferences: Pretty JSON Settings. From there you can also configure your own values. Here's a run down of the existing parameters, their meaning, and how you can configure each of them: use\_entire\_file if\_no\_selection: boolean that indicates whether the entire file should be used when there is no text selected. indent: integer that represents the number of spaces to be used. To use tab indentation, use \t instead. sort\_keys: boolean that indicates whether the JSON keys should be sorted alphabetically. ensure\_ascii: boolean that indicates whether it should validate that all characters are ASCII characters. line\_separator: string that represents the separator that will be used between lines. Usually this shouldn't be modified, to make sure the resulting JSON is valid. value\_separator: string that represents the separator that will be used between JSON keys and values. If you need to get rid of extra space after the colon, you can configure that using this parameter. keep\_arrays\_single\_line: boolean that indicates whether we need to re-structure arrays and make them single-line. max\_arrays\_line\_length: integer that determines the max length of single-line values. When the line exceeds this max length, it will be formatted in a multi-line fashion. pretty\_on\_save: boolean that indicates whether JSON files should be automatically prettified on each file save. validate\_on\_save: boolean that indicates whether JSON files should be automatically validated on each file save. brace\_newline: boolean that indicates whether there should be a newline after braces. bracket\_newline: boolean that indicates whether there should be a newline after brackets. true here means the resulting JSON will look like the Allman indentation style, while false will result in an OTBS indentation style. reindent\_block: if we are formatting a selection, if we need to reindent the resulting block to follow the flow of the source document the possible values are minimal and start. Using minimal the resulting json lines are indented as much spaces as the line where the selection starts. E.g.: yaml container: yaml key: { "json": "value" } Gets formatted as: yaml container: yaml key: { "json": "value" } Using start, the resulting json lines are indented a number of spaces equal to the column number of the start of the selection. With using the previous example gets formatted as: yaml container: yaml key: { "json": "value" } Use false if you wouldn't like the formatter to reindent the block at all. jq\_binary: path to the jq binary, e.g. /usr/bin/local/jq. Using tabs for indentation You can change configuration key indent to string value "\t" or any other string Be sure "Indent Using Spaces" is unchecked otherwise you will not see effect and ST3/4 will convert it back to spaces Contributors Others If you YAMLinting then maybe you interested in this plugin: PrettyYAML Effortlessly Split Panes and Navigate Between Code With the new Tab Multi-Select functionality, tabs become first-class citizens in the interface. A simple modifier when performing actions will split the interface to show multiple tabs at once. Works with the side bar, tab bar, Goto Anything and more! Side-by-Side Mode for Definitions The Definitions popup now supports side-by-side mode via the icon, or holding Ctrl+ while clicking a link. Goto Definition, Goto Reference and Goto Symbol in Project also support side-by-side viewing. Explore the full definition, not just a summary in a small popup. View Definitions in Auto Complete When an auto-complete word is a symbol with a definition, click the Definition link, or pressing F12 will open the definition to the right. When focus returns to the original file, the auto complete window will return to its last state. Use Multiple Selections to rename variables quickly Here Ctrl+D#+D is used to select the next occurrence of the current word. Ctrl+K, Ctrl+D#+K, #+D will skip an occurrence. Once created, each selection allows for full-featured editing. If you are working with json and want to view it in a pretty format within Sublime, you can install an extension very quickly. The long way on a Mac is to navigate to ~/Library/Application Support/Sublime Text 3/Packages and run this command from a terminal: git clone Restart Sublime and the open up some unformatted json and hit command+ctrl+j. It literally takes 1 minute. An even faster way is to use the package control. Hit command+shift+p to bring up a pop up text field and type "install package control". This places the file "Package Control.sublime-package" into ~/Library/Application Support/Sublime Text 3/Installed Packages. If you have this already, then just hit command+shift+p and type "package control: install package", and then type "pretty" and select Pretty JSON. Then restart Sublime. Done! This should take 30 seconds! Introduction of Sublime Pretty JSON Sublime Pretty JSON is an extension with Sublime for Prettifying JSON. Here comes another new word which is Sublime, so lets get some idea on this. Sublime is a complex text editor which is generally used by developers. It has some of the wide features like Auto Indentation, Sidebar, Macros, Plugins and Packages for working with code. Mostly, Python and JavaScript developers are the intended group who search for Text Editor IDE. Sublime Text Editor has the ability to solve Linker errors, keeps track of files and color combination of syntax with good connectivity of version control systems like GIT. Syntax of Sublime Pretty JSON Sublime Text is an easy option to Pretty format JSON, also we can prettify JSON in our browser. Steps to follow: Install Sublime Text 3 editor and Open it Based on OS, installation steps might change a bit. If MAC OS, press CMD+SHIFT+P, then select 'Install Package'. Search for 'Pretty JSON' and install. If Windows, press CTRL+SHIFT+P, then select 'Install Package'. Search for 'Pretty JSON' and install. Once the installation is done, select JSON string, If MAC OS, press CMD+CTRL+j else if Windows, press CTRL+ALT+j. With this we need not copy our JSON string from sublime, paste and format in browser, then copy formatted JSON in sublime like before. We can Pretty JSON in our text editor Sublime itself. Please refer the below screen prints for pretty JSON steps to be understood further. On opening Sublime Text Editor, Select Preferences a Package Control a Install Packages. On selecting Install Package, drop down will appear as to what packages user needs to install, here we are searching for Pretty JSON. Examples of Sublime Pretty JSON Following are the examples are given below: Example #1 Input: { "employees": { "employee": { "id": "100", "firstName": "Saideep", "lastName": "Reddy", "company": "Infosys" }, { "id": "200", "firstName": "Anusha", "lastName": "Kakarlapudi", "company": "Cognizant" }, { "id": "300", "firstName": "Karthick", "lastName": "Sai", "company": "Capgemini" }, { "id": "400", "firstName": "Harika", "lastName": "Reddy", "company": "IBM" } } } Output: Input JSON given in Sublime editor looks as below On giving command, CTRL+ALT+j, Example #2 Input JSON: { "firstName": "James", "lastName": "Bond", "mobile": ["123-456-789", "001-123-456-789"] }, { "firstnam": "James", "lastName": "Bond", "mobile": ["123-456-789", "002-123-456-789"] }, { "firstnam": "reddy", "lastName": "ponisha", "mobile": ["123-456-789", "003-123-456-789"] }, { "firstnam": "harika", "lastName": "rao", "mobile": ["123-456-789", "004-123-456-789"] }, { "firstnam": "krishnan", "lastName": "krishnan", "mobile": ["123-456-789", "004-123-456-789"] }, { "firstnam": "sai", "surname": "deep", "mobile": ["123-456-789", "005-123-456-789"] } } Output: Input looks like below in sublime Example #3 Input JSON in sublime: { "glossary": { "heading": "example glossary", "desc": { "heading": "S", "descList": { "title": { "ID": "SGML", "SA": "SGMMLL", "Term": "Standard Generalized Markup Language", "Acronym": "SGML", "Abbrev": "ISO 8879:1916", "definition": { "para": "A meta-markup language, used to create markup languages such as DocBook.", "GlossSeeAlso": ["GML", "XML"] }, "GlossSee": "markup" } } } } } Output: On pressing CTRL+ALT+j Example #4 { "widget\_json": { "debug": "on", "window": { "title": "Sample Konfabulator Widget", "name": "main window", "width": 520, "height": 100, "image": { "src": "Images/Sun.png", "name": "sun", "hOffset": 150, "vOffset": 150, "alignment": "side"}, "text": { "data": "Click Here", "size": 31, "style": "italic", "name": "textdesc", "hOffset": 150, "vOffset": 100, "alignment": "side", "onMouseHover": "sun1.opacity = (sun1.opacity / 100) \* 30;" } } } } Output: Sublime Pretty JSON works similar to JavaScript Pretty JSON where we use the Stringify method and define a 3rd parameter for indentation which is used for Prettifying JSON. Here, now we need to copy the JSON, paste it in browser for formatting the JSON, and then again paste it in our sublime text editor here. Inside Sublime itself, we are prettifying JSON using Package control where we can install various packages. Here we install Pretty JSON package and prettify JSON. Similarly, we have Pretty YAML, Python Pretty Print, HTML-CSS-JS-Pretty and Pretty Ruby and many more. For installing these packages, can be downloaded from a browser and copied into Sublime's package folder. First package to be installed with Package Control, without this user cant proceed with the installation of other packages. Basic packages to be installed with Sublime are Emmet, DocBlockr, Color Highlighter and Console Wrap, themes and color schemes. There are also some advanced packages like Markdown Preview, HTML5, SCSS, Markdown TOC, JSFormat, Better JavaScript, jQuery and AngularJS. Conclusion As we have seen what is Sublime and how is JSON prettified here in Sublime text editor IDE. With illustration of few simple examples of JSON Pretty, you people can explore even further on Sublime Editor as to what all the programming languages does it support. Various packages can be installed so you people can go and explore each and every package its use in Sublime. Pretty JSON in Sublime is easier way to Pretty JSON compared to Pretty JSON in JavaScript and Python using code and methods like stringify, space parameter in stringify method. Recommended Articles This is a guide to Sublime Pretty JSON. Here we also discuss the introduction and syntax of sublime pretty json along with different examples and its code implementation.
